Investigation of the low-energy kaons hadronic interactions in light nuclei by AMADEUS

Monday, 6 June 2016 09:30 (0:30)

Collaboration

AMADEUS

Abstract content

The AMADEUS experiment deals with the investigation of the low-energy kaon-nuclei hadronic interaction at the DA Φ NE collider at LNF-INFN, which is fundamental to solve longstanding questions in the non-perturbative strangeness QCD sector. AMADEUS step 0 consisted in the reanalysis of 2004/2005 KLOE data, exploiting K^- absorptions in H, 4 He, 9 Be and 12 C, leading to the first invariant mass spectroscopy study with very low momentum (100MeV) in-flight K^- captures. With AMADEUS step 1 a dedicated pure Carbon target was implemented in the central region of the KLOE detector, providing a high statistic sample of pure at-rest K^- nuclear interaction. The results obtained in the analyses of the hyperon-proton deuteron, and triton correlations, searching

The results obtained in the analyses of the hyperon-pion correlated events, searching for the resonant shapes of Y^* states, and the analyses of hyperon-proton, deuteron, and triton correlations, searching for possible K^- -multi nucleon bound states, will be presented.
